## Addendum # 2

### Arc Flash Analysis and Electric Panel Labeling Study

1. Please confirm if a copy of the scaled floor plans and the building one line will be given to the successful bidder.

We will provide the prints we do have. They are not as-builts and are not completely accurate. (The as-builts were destroyed in a fire.)

2. Please confirm that the only facility operational scenarios is either from the utility or in the event of utility loss, from the onsite generator(s).

The Civic Center is powered from either the utility (two utility power sources) or generator power. Two stationary generators are on site. A one line diagram is attached to illustrate the system (see attached).

3. Please confirm that labels for equipment on the secondary side of transformers less than 125kVA are not required.

*"Circuits less than 240 V supplied from transformers less than 125 kVA may be omitted from the computer model and will be assumed to have a hazard risk category 0."*

Section III.A.2.iii - above is to be deleted. The walk-through revealed there are several panels on the list to be labeled that are fed from transformers less than 125kVA. We would like to include these panels.

4. For Table A, please confirm that Panel Number "B" and "C" are not required for the 3<sup>rd</sup> floor S/E Air Handler area.

Table A, the last item "3rd floor S/E Air Handler" should include two panels: M-3 and P-10. The letters A. B. and C. are "typos" and should be omitted.

5. Please advise when the service entrance switchgear main and generator breakers were last tested to confirm that they are functioning as intended.

The service entrance switchgear main and generator breakers were last tested on 3/22/2010 by MET. One problem was found and corrected with the instillation of heat in all 9 sections of the cabinet.
